# Oxygen Gas Sensor

Model Number #SS2118

## - PRODUCT DESCRIPTION -

Electrochemical oxygen gas sensor(SS2118) controls oxygen gas flow with micro capillary hole. The output of SS2118 is linearly proportional to the oxygen concentration in the range of 0~30%. SS2118 doesn't measure the partial pressure of oxygen but the volume percent of oxygen in air. The output of SS2118 is very stable under operational temperature range. The oxygen gas sensor has speedy response time, stability state and long life time.

## - APPLICATIONS -

- Ideal for portable instrument
- Industry safety (ambient air monitoring applications)
- Combustion efficiency analysis
- etc.

## - OUTLINE DIMENSION -

*DUE TO ONGOING RESEARCH AND PRODUCT IMPROVEMENT, SPECIFICATIONS ARE SUBJECT TO CHANGE WITHOUT NOTICE*

# Oxygen Gas Sensor

Model Number #SS2118

## - SPECIFICATIONS -

Sensor Type: Galvanic cell (lead-oxygen battery)  
Measurement Range: 0 ~ 30% oxygen

Expected Operating Life: 24 months and more in 20.9% O<sub>2</sub>  
Output Signal: 90 ± 20μA in air @ 25°C 60% RH

Load resistor: 100Ω(Recommended)  
Response Time: < 15 seconds for 90% response  
Zero Offset : Less than 6 μA in 100% N<sub>2</sub> @ 25°C 60% RH

Temperature Range: -20 ~ 50 °C  
Pressure Range: Atmospheric 10%  
Operating Humidity: 0 ~ 99 % RH (non-condensing)  
Long Term drift: <2% signal/month

Storage Temperature: 5 ~ 20°C  
Warranty Period: 18 months from date of shipment under normal operating conditions

## - PERFORMANCE -

# Carbon monoxide Gas Sensor

Model Number #SS1128

## – PRODUCT DESCRIPTION –

The SS1128 carbon monoxide gas sensor is of Amperometric type. The SS1128 CO gas sensor can detect CO gases by taking out the energy generated by the redox reactions (oxidation/reduction) as electric energy. The CO gas sensor has various features that can not be expected for the conventional catalytic and semiconductor type sensors

- 1) Linear outputs to gas concentrations
- 2) Excellent reproducibility
- 3) Excellent gas selectivity
- 4) Low humidity dependency
- 5) Least power consumption for battery-operated detectors
- 6) Small-sized and light-weight for portable detectors

## – APPLICATIONS –

- Ideal for portable instrument
- Industry safety (ambient air monitoring applications)
- Residential CO alarms
- Fire alarms
- etc.

# Carbon monoxide Gas Sensor

Model Number #SS1128

## – SPECIFICATIONS –

Sensor Type : Electrochemical sensor (Amperometric type)  
Measurement Range : 0 ~ 500ppm CO gas

Expected Operating Life : 24 months and more  
Output signal :  $120 \pm 30\text{nA/ppm} < \pm 1.0\%$  Full scale @ constant  
Resolution : temperature and pressure  
 $T_{90}$  Response Time : < 30 seconds for 90% response  
Output linearity : Linear  
Bias voltage : Not required  
Typical baseline range : -2 to 3ppm

Temperature Range : -20 ~ 50 °C  
Pressure Range : Atmospheric  $\pm 10\%$   
Operating Humidity : 15 ~ 90 % RH (non-condensing)  
Long term drift : Less than 5% /year

Weight : 6g  
Storage life : 6 month  
storage temperature : 0~20 °C  
Warranty period : 24 month

N. B. All performance data is based on conditions at 20°C, 60% RH, and 1atm

# Hydrogen sulfide

## Gas Sensor Model Number #SS1198

### - PRODUCT DESCRIPTION -

The SS1198 hydrogen sulfide gas sensors operate using well known fuel cell technology (Amperometric type). The SS1198 H<sub>2</sub>S gas sensor can detect H<sub>2</sub>S gases by taking out the energy generated by the redox reactions (oxidation/reduction) as electric energy. The SS1198 H<sub>2</sub>S gas sensors offers good, reliable detection performance and has various features that can not be expected for the conventional catalytic and semiconductor type sensors

- 1) Linear outputs to gas concentrations
- 2) Excellent reproducibility
- 3) Excellent gas selectivity
- 4) Low humidity dependency
- 5) Least power consumption for battery-operated detectors
- 6) Small-sized and light-weight for portable detectors

### - APPLICATIONS -

- Ideal for portable instrument
- Industry safety (Petrochemical, Refineries)
- Sewers, Wastewater treatment,
- Mining
- etc.

### FEATURES

- ★ Contains all the necessary optics, electronics and firmware to provide a linearized, temperature-compensated output.
- ★ Choice of output format – direct pellistor replacement, industry standard 0.4 to 2 volts dc or digital.
- ★ Instantly converts existing compatible pellistor-based instruments to infrared.
- ★ Sensors can be factory configured to customer specification.
- ★ All sensor types are user configurable using configuration equipment available from Dynamant.
- ★ Fast track route for original equipment manufacturers to introduce the latest infrared technology – without any specialist knowledge.
- ★ Internal Flash memory allowing sensor firmware updates via configuration equipment.

## DESCRIPTION

Dynamant infrared sensors operate by using the NDIR principle to monitor the presence of target gas. The sensor contains a long life tungsten filament infrared light source, an optical cavity into which gas diffuses, a dual temperature compensated pyroelectric infrared detector, an integral semiconductor temperature sensor and electronics to process the signals from the pyroelectric detector .

Two versions are available:-

### **3 Pin Version - Pellistor Replacement Infrared**

These sensors provide a pellistor style linearised, temperature-compensated output as shown in Graph 1.

They can either be supplied pre-set to customer specification or may be configured by the user by means of a configuration unit available from Dynamant Ltd. The output signal can be set to rise or fall with increase in the gas level.

### **5 Pin Version - Multi-Purpose Range**

This version of the sensor provides maximum user flexibility by providing the following output options:-

- ★ Industry Standard 0.4 to 2 volt linearised, temperature-compensated output as shown in Graph 2, or alternative voltages for zero and FSD outputs.
- ★ Digital output for direct communications with instrument electronics.
- ★ Rising or falling output with increasing gas level.

The digital output is a UART format comprising 8 data bits, 1 stop bit and no parity. Refer to specification for available baud rates.

**Graph 1**  
**Pellistor Replacement Output Characteristic**

**Graph 2**  
**0.4 – 2 Volt Output Characteristic**

## Hydrocarbon Response Characteristics

The Premier range of hydrocarbon infrared gas sensors are calibrated to provide an output signal linearised for a specific gas type and concentration during manufacture.

However, the sensor will also respond to a range of other hydrocarbon gases. The following graphs show the relative response of a methane sensor, and a propane sensor, to some of the common hydrocarbons.

These characteristics can be used as a guide to setting up the associated instrument alarm levels.

Note – Refer to data sheet TDS0050 for additional cross reference data

## Hydrocarbon Temperature Compensation

The Premier sensor is temperature compensated over the range of -20°C to +50°C. The output variation is  $\pm 2\%$  FSD or  $\pm 10\%$  of the reading up to 50% FSD and  $\pm 15\%$  of the reading from 50% to 100% FSD, whichever is greater.

The following graph is based on the hydrocarbon sensor being characterised for methane.

## Hydrocarbon Linearity

The Premier sensor linearity at ambient temperature is  $\pm 2\%$  FSD or  $\pm 10\%$  of the reading which ever is greater.

The following graph is based on the hydrocarbon sensor being characterised for methane, data based on 24 sensors.

## Calibration options

Dynamant recommend a maximum interval of 12 months between calibration checks. A small amount of zero drift can be accommodated by re-zeroing the gas detector against the sensor. The degree of drift that is acceptable should be determined by the user. Note that the subsequent change in gas reading will be greater than the change in zero reading. If the sensor requires either a "Zero" or "Span" adjustment, there are three methods that can be used:

- 1) By using the "Premier Configuration Unit"  
When used in conjunction with dedicated PC software, this device uses the data communication pins on the sensor to provide a means of calibration. Refer to data sheet TDS0043 for additional information.
- 2) By using the data communications pins and software written in accordance with the protocol supplied by Dynamant.
- 3) By using the "Manual Calibration" feature available with firmware version 1.5.2R.  
"Zero" and "Span" operations can be performed by momentarily connecting the data communication pins to the negative supply pin. Refer to data sheet TDS0064 for full instructions. The "Manual Calibration" option must be specified when the sensors are ordered.

## Sensor warm-up time

When power is first applied to the sensor, the voltage at the output pin is held at a pre-determined level. The default setting for this start-up value is the "zero gas" value. This condition is maintained for a default "warm-up" time of 15 seconds, after this time the output voltage represents the calculated gas value. Sensors can take up to 1 minute to indicate the correct gas reading.

Note: the sensor can output any reading from -100% FSD to +200% FSD in the first minute. The output value that is read using the communications pins is always held at zero during the "warm-up" time.

Both the voltage at the output pin during the "warm-up" time, and the duration of the "warm-up" time can be pre-programmed to alternative values at the time of ordering sensors.

## Temperature transients and gas flow rates.

The Premier sensor employs a pyroelectric detector, the output from which can be disrupted by sudden changes in temperature. If there is an excessive change in the ambient temperature, gas sample temperature or flow rate, then the output signal will be momentarily frozen. Correct operation is restored when the effects of the transient have settled. Rates of change in the ambient temperature should be restricted to 2°C/minute and gas flow rates kept below 600 cc/minute.

## Power supply considerations

The sensor power supply rise time must be less than 50 mS to ensure correct operation. Operation outside the range of 3 – 5 V dc will result in either fault indication, or the sensor will not function correctly.

## Sensor over-range condition

The sensor will continue to provide an output up to 200% of the full scale value; at this point the reading is clamped, regardless of any further increase in detected gas level. The linearity of the output is only guaranteed up to the full scale for the sensor; the over-range condition should therefore be determined and indicated by the host instrument.

## Sensor fault indication

The sensor constantly performs checks on the internal memory contents, the incoming supply voltage and the analogue signal values. These checks are used to ensure that the sensor is operating within its correct parameters, and that no internal faults have developed.

If a fault condition is detected, the output value is set to -100% FSD. In the case of a sensor with a voltage output that is scaled, 0.4 – 2.4V, for example, the output will be set to 0V under fault conditions

It is not recommended to choose an output voltage of 0V for zero-gas, because the fault condition cannot then be distinguished from the zero-gas condition.

The output value that is read when using the communications pins, instead of the voltage output pin, will be set to -100% FSD under fault conditions.

As mentioned in the “Sensor warm-up time” section above, the voltage at the output pin during the warm-up time can be specified when ordering sensors. It should be noted that if a start-up voltage is chosen that represents the zero-gas condition, then should a fault subsequently develop leaving the sensor unable to drive the output to -100% FSD, this condition cannot be detected by the host instrument.

The start-up voltage that is equivalent to zero-gas was chosen as the default setting because, in a large number of applications, the host instrument would otherwise indicate fault during the warm-up period.

## Digital interface

The digital communication pins “RX” and “TX” operate at a 2.8V logic level. When interfacing to external circuitry that uses a higher voltage level it is necessary to limit the current that can flow. The external voltage level should be 5V maximum and a 3K3 resistor should be used in series with each communication pin.

## Warranty information

All Dynamant Premier sensors carry a two year warranty against defects in materials and workmanship. The warranty is invalidated if the sensors are used under conditions other than those specified in this data sheet.

Particular attention should be paid to the following criteria:

- **Observe the correct supply polarity**
- **Do not exceed the maximum rated supply voltage of 5V**
- **Do not solder directly to the sensor pins**
- **Do not expose the sensor to corrosive gases**
- **Do not allow condensation to take place within the sensor**

## SPECIFICATION

## MECHANICAL DETAIL

## NOTES

1. DIMENSIONS WITHOUT TOLERANCES ARE NOMINAL.
2. RECOMMENDED PCB SOCKET WEARNES CAMBION LTD CODE: 450-3326-01-06-00.
3. WEIGHT: 15g
4. USE ANTI-STATIC PRECAUTIONS WHEN HANDLING
5. DO NOT CUT PINS
6. DO NOT SOLDER DIRECTLY TO PINS

**NOTE – The above pin configuration is shown for the POSITIVE version of the sensor. The NEGATIVE version has the +ve and –ve supply pin positions exchanged. See ordering details.**

**Dynamment reserve the right to alter technical specifications without prior notice**

## Ordering Details

In order to completely specify the type of sensor that is required, the customer needs to provide the following information:-

- An Order Code (see below) that specifies the sensors' basic physical and electrical characteristics.
- The sensor configuration requirements.

### Available sensor options:

F = Replaceable, self adhesive microporous PTFE filter

### EXAMPLE OF ORDER CODES

MSH – P / HC / 3 / B / P / F

### CONFIGURATION OPTIONS

(To be stated on customer order in addition to the Order Code)

1. Output voltage for zero.
2. Output voltage for span.
3. Rising or falling output voltage with increasing gas level.
4. Sensitivity e.g. 20 mV / % volume CH<sub>4</sub>.
5. Communication speed – 38,400 baud (default), specify alternative rate if required.

## Pellistor Replacement - Explanation of Positive & Negative Polarity

Typical Pellistor Pinout

Premier Negative Polarity Option

Use where the DET pin of the existing pellistor is connected to the Negative of the pellistor bridge supply.

Premier Positive Polarity Option

Use where DET pin of the existing pellistor is connected to the Positive of the pellistor bridge supply.

Note – On the 3 pin version of the sensor, the RX and TX connections are pads, not pins.

### FEATURES

- ★ Contains all the necessary optics, electronics and firmware to provide a linearized, temperature-compensated output.
- ★ Choice of output format – direct pellistor replacement, industry standard 0.4 to 2 volts dc or digital.
- ★ Provides the option to convert existing compatible pellistor-based instruments to infrared Carbon Dioxide.
- ★ Sensors can be factory configured to customer specification.
- ★ All sensor types are user configurable using configuration equipment available from Dynamant.
- ★ Fast track route for original equipment manufacturers to introduce the latest infrared technology – without any specialist knowledge.
- ★ Internal Flash memory allowing sensor firmware updates via configuration equipment.

## DESCRIPTION

Dynamant infrared sensors operate by using the NDIR principle to monitor the presence of target gas. The sensor contains a long life tungsten filament infrared light source, an optical cavity into which gas diffuses, a dual temperature compensated pyroelectric infrared detector, an integral semiconductor temperature sensor and electronics to process the signals from the pyroelectric detector .

Two versions are available:-

### **3 Pin Version - Pellistor Replacement Infrared**

These sensors provide a pellistor style linearized, temperature-compensated output as shown in Graph 1.

They can either be supplied pre-set to customer specification or may be configured by the user by means of a configuration unit available from Dynamant Ltd. The output signal can be set to rise or fall with increase in the gas level.

### **5 Pin Version - Multi-Purpose Range**

This version of the sensor provides maximum user flexibility by providing the following output options:-

- ★ Industry Standard 0.4 to 2 volt linearized, temperature-compensated output as shown in Graph 2, or alternative voltages for zero and FSD outputs.
- ★ Digital output for direct communications with instrument electronics.
- ★ Rising or falling output with increasing gas level.

The digital output is a UART format comprising 8 data bits, 1 stop bit and no parity. Refer to specification for available baud rates.

**Graph 1**  
**Pellistor Replacement Output Characteristic**

**Graph 2**  
**0.4 - 2 Volt Output Characteristic**

## Carbon dioxide Temperature Compensation

The Premier sensor is temperature compensated over the range of -20°C to +50°C. The output variation is  $\pm 1\%$  v/v or  $\pm 10\%$  of the reading up to 50% FSD and  $\pm 15\%$  of the reading from 50% to 100% FSD, whichever is greater.

## Carbon dioxide Linearity

The Premier sensor linearity at ambient temperature is  $\pm 2\%$  FSD or  $\pm 10\%$  of the reading up to 80% FSD and  $\pm 15\%$  of the reading from 80% to 100% FSD, whichever is greater.

The following graph is based on the 0-100% v/v sensor, data for 24 sensors.

## Calibration options

Dynamant recommend a maximum interval of 12 months between calibration checks. A small amount of zero drift can be accommodated by re-zeroing the gas detector against the sensor. The degree of drift that is acceptable should be determined by the user. Note that the subsequent change in gas reading will be greater than the change in zero reading. If the sensor requires either a "Zero" or "Span" adjustment, there are three methods that can be used:

- 1) By using the "Premier Configuration Unit"  
When used in conjunction with dedicated PC software, this device uses the data communication pins on the sensor to provide a means of calibration. Refer to data sheet TDS0043 for additional information.
- 2) By using the data communications pins and software written in accordance with the protocol supplied by Dynamant.
- 3) By using the "Manual Calibration" feature available with firmware version 1.5.2R.  
"Zero" and "Span" operations can be performed by momentarily connecting the data communication pins to the negative supply pin. Refer to data sheet TDS0064 for full instructions. The "Manual Calibration" option must be specified when the sensors are ordered.

## Sensor warm-up time

When power is first applied to the sensor, the voltage at the output pin is held at a pre-determined level. The default setting for this start-up value is the "zero gas" value. This condition is maintained for a default "warm-up" time of 15 seconds, after this time the output voltage represents the calculated gas value. Sensors can take up to 1 minute to indicate the correct gas reading.

Note: the sensor can output any reading from -100% FSD to +200% FSD in the first minute. The output value that is read using the communications pins is always held at zero during the "warm-up" time.

Both the voltage at the output pin during the "warm-up" time, and the duration of the "warm-up" time can be pre-programmed to alternative values at the time of ordering sensors.

## Temperature transients and gas flow rates.

The Premier sensor employs a pyroelectric detector, the output from which can be disrupted by sudden changes in temperature. If there is an excessive change in the ambient temperature, gas sample temperature or flow rate, then the output signal will be momentarily frozen. Correct operation is restored when the effects of the transient have settled. Rates of change in the ambient temperature should be restricted to 2°C/minute and gas flow rates kept below 600 cc/minute.

## Power supply considerations

The sensor power supply rise time must be less than 50 mS to ensure correct operation. Operation outside the range of 3 – 5 V dc will result in either fault indication, or the sensor will not function correctly.

## Sensor over-range condition

The sensor will continue to provide an output up to 200% of the full scale value; at this point the reading is clamped, regardless of any further increase in detected gas level. The linearity of the output is only guaranteed up to the full scale for the sensor; the over-range condition should therefore be determined and indicated by the host instrument.

## Sensor fault indication

The sensor constantly performs checks on the internal memory contents, the incoming supply voltage and the analogue signal values. These checks are used to ensure that the sensor is operating within its correct parameters, and that no internal faults have developed.

If a fault condition is detected, the output value is set to -100% FSD. In the case of a sensor with a voltage output that is scaled, 0.4 – 2.4V, for example, the output will be set to 0V under fault conditions

It is not recommended to choose an output voltage of 0V for zero-gas, because the fault condition cannot then be distinguished from the zero-gas condition.

The output value that is read when using the communications pins, instead of the voltage output pin, will be set to -100% FSD under fault conditions.

As mentioned in the “Sensor warm-up time” section above, the voltage at the output pin during the warm-up time can be specified when ordering sensors. It should be noted that if a start-up voltage is chosen that represents the zero-gas condition, then should a fault subsequently develop leaving the sensor unable to drive the output to -100% FSD, this condition cannot be detected by the host instrument.

The start-up voltage that is equivalent to zero-gas was chosen as the default setting because, in a large number of applications, the host instrument would otherwise indicate fault during the warm-up period.

## Digital interface

The digital communication pins “RX” and “TX” operate at a 2.8V logic level. When interfacing to external circuitry that uses a higher voltage level it is necessary to limit the current that can flow. The external voltage level should be 5V maximum and a 3K3 resistor should be used in series with each communication pin.

## Warranty information

All Dynament Premier sensors carry a two year warranty against defects in materials and workmanship. The warranty is invalidated if the sensors are used under conditions other than those specified in this data sheet.

Particular attention should be paid to the following criteria:

- **Observe the correct supply polarity**
- **Do not exceed the maximum rated supply voltage of 5V**
- **Do not solder directly to the sensor pins**
- **Do not expose the sensor to corrosive gases**
- **Do not allow condensation to take place within the sensor**

## SPECIFICATION

## MECHANICAL DETAIL

## NOTES

1. DIMENSIONS WITHOUT TOLERANCES ARE NOMINAL.
2. RECOMMENDED PCB SOCKET WEARNES CAMBION LTD CODE: 450-3326-01-06-00.
3. WEIGHT: 15g
4. USE ANTI-STATIC PRECAUTIONS WHEN HANDLING
5. DO NOT CUT PINS
6. DO NOT SOLDER DIRECTLY TO PINS

**NOTE – The above pin configuration is shown for the POSITIVE version of the sensor. The NEGATIVE version has the +ve and –ve supply pin positions exchanged. See ordering details.**

**Dynamment reserve the right to alter technical specifications without prior notice**

## Ordering Details

In order to completely specify the type of sensor that is required, the customer needs to provide the following information:-

- An Order Code (see below) that specifies the sensors' basic physical and electrical characteristics.

|                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Conversion of Pellistor-Based Instruments to Measure Carbon Dioxide - Explanation of Positive & Negative Polarity

Typical Pellistor Pinout

**Premier Negative Polarity Option**

Use where the DET pin of the existing pellistor is connected to the Negative of the pellistor bridge supply.

**Premier Positive Polarity Option**

Use where DET pin of the existing pellistor is connected to the Positive of the pellistor bridge supply.

Note – On the 3 pin version of the sensor, the RX and TX connections are pads, not pins.
